Contextual analysis

Domestic tourism

In 2015, British residents took 102.7 million overnight trips in England, totalling 300 million nights away from home, with an expenditure of £19.6 billion. £191 was spent per trip, and with an average trip length of 2.92 nights, the average spend per night was £65.

The East of England region experienced a 8% increase in overnight trips during 2015. Bednights were down 5% on 2014 and expenditure was up by 2%. This resulted in an decrease in the average length of trips (the number of night per trip) from 3.3 nights per trip in 2014 to 2.9 in 2015. The average spend per night was up from £53.4 per night in 2014 to £57.7 in 2015. The region received a more visitors in 2014 than in the previous year. However, those who did visit stayed for shorter periods of time, meaning that overall trip expenditure was down from £178.7 per trip in 2014 to £167.5 in 2015.

Visits from overseas

The number of visits in 2015 grew 5% to a record 36.1 million, after several years of growth since 2010. Average spend per visit was £611 in 2015, down from the peak of £650 per visit in 2013 and reflecting the relative strength of sterling in 2015.

The number of visitor nights spent in the UK increased by 3% in 2015 to 273 million, with the average number of nights per visit standing at 7.6.

Overseas trips to the East of Engalnd region were 4% up on 2014 to reach 2.2 million overnight trips. The total number of nights was down by 1% to reach 16.7 million in 2015. Spend was also down less than 1% to £960 million in 2015.

The International Passenger Survey (IPS) is conducted by Office for National Statistics and is based on face- to-face interviews with a sample of passengers travelling via the principal airports, sea routes and the Channel Tunnel, together with visitors crossing the land border into Northern Ireland. The number of interviews conducted in England in 2015 was around 35,000. This large sample size allows reliable estimates to be produced for various groups of passengers despite the low proportion of travellers interviewed. The IPS provides headline figures, based on the county or unitary authority, for the volume and value of overseas trips to the UK. The sample for East of England was 2,450 interviews.

How accurate is the Regional data?

The regional data has to be interpreted with lots of caution, as the IPS has never been designed to be able to produce highly accurate results at regional level. Whilst the survey gives good precision at the national level, regional breakdowns of the data will almost inevitably lead to less reliable results. For example although the sample size for Merseyside was 322 in 2004 the margin of error for visits to this area is 40.9%. We have to bear in mind that although the IPS matches accurately the overall volume of overseas visitors coming to the UK, the IPS does not give a precise picture of where these overseas visitors stayed during their stay in the UK. This is because some interviews are not done in a few regional airports. For example until 2005 no interviews were carried at Prestwick and Liverpool airports, which may have resulted into less accurate estimates for Scotland and Northern England.

The International Passenger Survey (IPS) data is a key driver for the Cambridge model and as outlined above, needs to be used with caution when looking at regional level data. We have applied a 3 year rolling average to this data to help smooth out short term market fluctuations and highlight longer-term trends.

Day visitors

During 2015, GB residents took a total of 1,525 million Tourism Day Visits to destinations in England, Scotland or Wales. Around £54 billion was spent during these trips.

The largest proportion of visits were taken to destinations in England (1,298 million visits or 85% of the total) while 8% of visits (124 million) were taken to Scottish destinations and 5% to places in Wales (75 million). The distribution of expenditure during visits broadly reflects this pattern.

The regional distribution of visits generally reflects the population distribution with the notable exception of London which is the destination for 18% of visits but place of residence for just 13% of the population. Within the English regions, the highest volume of visits was taken in London (280 million visits) where the total value of day visits during 2015 was around £11.6 billion.

The volume and value of Tourism Day Visits in the East of England decreased between 2014 and 2015 from 130 million to 118 million with a similar level of decrease (about 10%) in expenditure (down to £3.5billion) .

Please note that the Cambridge Model uses three year rolling averages to reduce extreme fluctuations which are due to small sample sizes, rather than being a reflection on changes in demand year-on-year.

Breakdown of expenditure

Breakdown of expenditure

Other expenditure associated with tourism activity

Other expenditure associated with tourism activity - Estimated spend				
Second homes	Boats	Static vans	Friends & relatives	Total
£22,004,000	£2,740,710	£18,034,808	£99,859,000	£142,638,518

Spend on second homes is assumed to be an average of £2,000 on rates, maintenance, and replacement of furniture and fittings. Spend on boats assumed to be an average of £2,000 on berthing charges, servicing and maintenance and upgrading of equipment. Static van spend arises in the case of vans purchased by the owner and used as a second home. Expenditure is incurred in site fees, utility charges and other spending and is estimated at £2,000. Additional spending is incurred by friends and relatives as a result of people coming to stay with them. A cost of £175 per visit has been assumed based on national research for social

Direct Turnover Derived From Trip Expenditure

Business turnover arises as a result of tourist spending, from the purchase of supplies and services locally by businesses in receipt of visitor spending and as a result of the spending of wages in businesses by employees whose jobs are directly or indirectly supported by tourism spending.

		Staying Visitor	Day Visitors	Total
Accommodation		£220,644,000	£11,621,000	£232,265,000
Retail		£112,283,000	£492,141,000	£604,424,000
Catering		£176,113,000	£563,604,000	£739,717,000
Attractions		£87,305,000	£175,324,000	£262,629,000
Transport		£72,699,000	£109,600,000	£182,299,000
Non-trip spend		£142,638,518	£0	£142,638,518
Total Direct	2015	£811,682,518	£1,352,290,000	£2,163,972,518
Comparison	2014	£803,882,518	£1,289,921,000	£2,093,803,518
Difference		1%	5%	3%

Adjustments have been made to recognise that some spending on retail and food and drink will fall within attractions or accommodation establishments. It is assumed that 40% of travel spend will take place at the origin of the trip rather than at the destination.

Supplier and Income Induced Turnover

		Staying Visitor	Day Visitors	Total

The key 2015 results of the Economic Impact Assessment are:

42.7 million trips were undertaken in the area
39.7 million day trips
3.1 million overnight visits

12.1 million nights in the area as a result of overnight trips

£2,143 million spent by tourists during their visit to the area
£179 million spent on average in the local economy each month.

£718 million generated by overnight visits
£1,425 million generated from irregular day trips.

£3,055 million spent in the local area as result of tourism, taking into account multiplier effects.

61,521 jobs supported, both for local residents from those living nearby.
42,709 tourism jobs directly supported
18,813 non-tourism related jobs supported linked to multiplier spend from tourism.

Appendix I - Introduction about Cambridge Model

This report examines the volume and value of tourism and the impact of that expenditure on the local economy. The figures were derived using the Cambridge Economic Impact Model and the research was undertaken by Destination Research.

The model utilises information from national tourism surveys and regionally based data held by Destination Research. It distributes regional activity as measured in those surveys to local areas using 'drivers' such as the accommodation stock and occupancy which influence the distribution of tourism activity at local level.

Limitations of the Model

The methodology and accuracy of the above sources varies. The results of the model should therefore be regarded as estimates which are indicative of the scale and importance of visitor activity in the local area. It is important to note that in the national tourism surveys the sample sizes for each area changes year on year. This is as a result of the random probability nature of the methodology. As such, the results of the Cambridge Model are best viewed as a snapshot in time and we would caution against year-on-year comparisons.

It should be noted that the model cannot take into account any leakage of expenditure from tourists taking day trips out of the area in which they are staying. While it is assumed that these may broadly balance each other in many areas, in locations receiving significant numbers of day visitors from London, there is likely to be an underestimate in relation to the number of overseas day visitors staying in holiday accommodation in London.

Whilst it is important to be aware of these issues, we are confident that the estimates we have produced are as reliable as is practically possible within the constraints of the information available.

Rounding

All figures used in this report have been rounded. In some tables there may therefore be a slight discrepancy between totals and sub totals.

Data sources

The main national surveys used as data sources in stage one include:

- Great Britain Tourism Survey (GBTS) - information on tourism activity by GB residents;
- International Passenger Survey (IPS) information on overseas visitors to the United Kingdom;
- Day Visits in the annual Great Britain Day Visitor Survey using information on visits lasting more than 3 hours and taken on an irregular basis

These surveys provide information down to a regional level. In order to disaggregate data to a local level the following information sources are used:

- Records of known local accommodation stock held by Destination Research;
- VisitEngland's surveys of Visits to Attractions, which provide data on the number of visitors to individual tourist attractions ;
- Mid- 2014 estimates of resident population as based on the 2011 Census of Population;
- Selected data from the 2011 Census of Employment;
- Selected data on the countryside and coast including, national designations and length of the coastline.

Staying Visitors

The GBTS provides information on the total number of trips to the region and the relative proportions using different types of accommodation. By matching these figures to the supply of such accommodation, the regional average number of trips per bedspace or unit of accommodation can be derived. The IPS provides information on the total number of trips by overseas visitors to the region. The model uses three year rolling averages to reduce extreme highs and lows which are due to small sample sizes, rather than being a reflection on drastic changes in demand year-on-year.

Day Visitors

Information on day trips at the regional level is available from the Day Visits in Great Britain survey. The survey includes all leisure-related trips from home. It should be noted that a large proportion are local trips made by people resident in the locality. The model uses information from the survey to estimate the number of longer day trips (defined as those lasting at least 3 hours and involving travel of more than 20 miles) and irregular trips lasting more than 3 hours.

Impact of tourism expenditure

This section examines the impact of the tourism expenditure in terms of the direct, indirect and induced expenditure as well as an estimate of the actual jobs (both direct and indirect) supported by tourism expenditure in the district.

The GBTS, IPS and Day Visits to Great Britain survey data on the breakdown of visitor spending. The impact of this initial round of expenditure will be subsequently increased by multiplier effects. These arise from the purchase of supplies and services by the businesses in receipt of visitor expenditure (indirect impacts), and by the income induced-effects arising from the spending of wages by employees in the first round of business and in subsequent expenditure in supplier business (induced impacts).

The New Earnings Survey which provides information on wage levels by industry sector and region; An internal business database which includes data on the structure of business expenditure, local linkages and multiplier ratios drawn from a wide range of business and economic studies carried out by Geoff Broom Associates, PA Cambridge Economic Consultants and others. By applying the breakdown to the estimates of visitor spending, the model generates estimates of total direct spending.

Evidence from national studies suggests that some minor adjustments are required to match visitor spend to business turnover – for example, some expenditure on food and drink actually takes place in inns and hotels that fall in the accommodation sector and within attractions. More significantly, expenditure on travel costs associated with individual trips is equally likely to take place at the origin of the trip as the destination. Therefore the model assumes that only 40% of travel expenditure accrues to the destination area.

Number of full time job equivalents

Having identified the value of turnover generated by visitor spending, it is possible to estimate the employment associated with that spending. Wages for staff and drawings for the proprietors will absorb a proportion of that turnover. By applying these proportions to the overall additional turnover in each sector, the amount of money absorbed by employment costs can be calculated. The New Earnings Survey provides data from which the average costs by business sector, adjusted to take account of regional differences, can be calculated.

by business sector, adjusted to take account of regional differences, can be calculated.

After allowing for additional costs such as National Insurance and pension costs, an average employment cost per full time equivalent job can be estimated. The number of such jobs in the local area can then be estimated by dividing the amount of business expenditure on wages and drawings by the average employment cost per job.

Number of Actual Jobs

The model generates estimates of full time equivalent jobs based on visitor spending. However, the total number of actual jobs will be higher when part time and seasonal working is taken into account. The full time equivalent jobs arising directly from visitor spending are converted into actual jobs using information from business surveys in the sectors receiving visitor spending. In general, the conversion factor varies around 1.5 in those sectors.

The indirect and induced jobs arise across a much wider range of employment sectors. Therefore, the average 1.16 for all sectors based on Census of Employment data has been used to convert full time equivalent jobs in this sector to actual jobs.

The employment estimates generated by the model include both self employed and employed people supported by visitor expenditure. The model also includes an estimate of the additional jobs arising in the attractions sector, which are not related to visitor expenditure. However, the numbers do not include other tourism-related employment such as jobs in local authorities arising from their tourism functions, e.g. tourist information staff, additional public health, parks and gardens, public conveniences, maintenance sections and jobs arising from capital investment in tourism facilities.
